Maquina de costura singer zig zag antigua manual pdf free printable version

I'm not robot!

Singer Starlet Electric Sewing Machine A sewing machine is a machine used to sew, in 1846,[1] it has significantly improved its efficiency and productivity in the textile industry. The domestic sewing machines are designed so that a person can sew individual items using a certain type of stitch. In a modern sewing machine, the fabric slides through the machine without need of needles or cups, making the task faster than with manual seam. Industrial machines, on the other hand, are bigger and faster, facilitating better tissue production. The sewing machines can variety of straight stitches or in the pattern. It includes means to drag, hold and move the fabric under the sewing needle to form the stitch pattern. Most home sewing machines and some industrialists use chain or chain stitches. History Old Singer sewing machine At the beginning of 1800 the sewing was handmade; families shook the pants, shirts, shoes and dresses with a needle and thread, but the history of the sewing machine would not exist without the old hand sewing art, which exists more than 10,000 years, when the first needles were made with bones or animals and the thread made of animal tendons. [2] Although the first patent for a sewing machine, for chain stitches, was granted to the British Thomas Saint in 1790, it was designed to sew skin and fabric, used a single thread and formed a chain stitch,[3] 35 years earlier, to the German engineer Charles Fredrick Wiesenthal, attached in England, is awarded the first patent for a machine-friendly sewing needle. [4] Structure The typical structure of the sewing machine is composed of a base on which the arm of the machine is supported. At the base are the mechanismsthe drag of the fabric and arm are the motion mechanisms of the needle. On the outside are the pulleys that determine the thread's tension. The controls of the length of the stitch, of the upper and lower thread, and of the presiding of the press are usually found in the body of the machine. The body also includes a lower thread coiling mechanism that also serves to get good structure in everything we want to sew. Characteristics Tip Types Machine of sewing singer - (old), in full work. The sewing machines perform a wide variety of stitches; flat (used for any helpful task), decorative (used to embellish) and flexible (for when we sew elastic fabrics). ISO 4915:1991 recognizes more than thirty stitches, in which formation is needed from one to seven ends. The flat stitches are categorized into four types: pespunte, remallado, coating and chain. Pespunte The pespunte, also known as a straight, flat or lockstitch stitch, is the most common stitch, made by the majority of homemade and industrial sewing machines that use two ends, one of which passes through the needle and the other originates in a coil or shuttle. Each corporal remains on the same side of the material that is sewing, intertwining with the other thanks to the movement of the hook or shuttle. The flat stitch can be made anywhere in the material that is sewing, not necessarily near the edge. Scheme of the creation of the Zigzag straight stitch The zigzag stitch is a geomÃ©tric variant of the straight stitch. To create the zigzag, a leva attached to the needle bar creates the movement of the vaivÃ©n. This stitch is used to prevent the fabric's deshilachation, sewing elatic materials, and to heal. Enameled The glazed, also known as overlock stitch or steak, formsone to four ends, one or two needles and one or two knitters (Loopers). The remaller or fillets are usually equipped with blades that cut or create the ort immediately at the head of the stitch. Commonly mostly use two to four ends, and frequently the same minor can be configured to make different stitch variations. The mãàquines that use five or more ends, in addition they can create a chain stitch with a needle and a looper, and an overlock stitch with the remaining needle and loop. This combination is known as security stitch. A similar stitch, created with two needles and two loops, is known as Mock Safety. Remallars are used commonly to sew knit or eligible fabrics, light tissues that do not need seams to be open, and to protect the frayed sections. Remallado of 4 cabos coating the stitch coating, also known as collar, collaretera or coverstitch, is formed with two or more or more needles and one or two junk. Like the flat and chain stitches, they can be done anywhere in the material that is sewn. A shuttle manipulates a corporal under the material that is being sewn, forming a coverage stitch next to the ends of the needles. An additional shuttle on the material can form a coverage stitch on the material. The ends of the needles create parallel ranks while the capes of the knitters cross them from one place to another. It is chain, the chain stitch is formed by means of a needle and a shuttle, which forms ties under the material sewn. This stitch was widely used in the first mining masters but was replaced by the straight stitch because it is undone fiercely when they were moving or cutting one of the ends that compose it. Other types of eyelet stitch for this type of stitch must press them to make eyelets. Depending on the sewing machine, the buttonhole can be made in four steps or in one, i.e. by moving the selector disk four times or just one. Overhilated Overhilar is to remove the edge of a seam that will remain on the inner edge of a garment so that it is not removed. To overcome with a domestic sewing machine we must use the stitch known as zigzag; once we pass the seam that will hold the two garments that we want to unite, we will go over-silver placing the edge of the fabric in the middle of the presses. Transportation It is called transport or drag to the system used by the machine to transport the fabric while the stitches are made. This function semi-automates the seam; the transport is made with a dented plate placed between the shuttle or crab and the press. This plate is known as denture due to its characteristic form. The modern machines allow the replacement of this piece according to the material to be sewn, or the type of stitch; however this is not the only type of transport used: domestic machines allow to transport the fabric with a movement of the presses together with the movement of the teeth; this is called double transport or drag. In the case of industrial machines, they perform some of this dual transport or drag function involving the press, and others with a movement of advance on the needle; these are also called double transport or drag. In the case of some industrial machines there is a combination of the three drag systems involving the dented plate, the press and the needle. This is called triple transport; the type of transport varies according to the thickness of the fabric and the speed of production to which the machine is destined. Sewing Needle Types The needle has severalGod . According to edue a embal alum ,abancan sabane sabanea , Rolame , lame , , says tabɔba 4 section 4 section 4-44).
